YourDOST EIR assignment: interview prep

Chethan N. Everything end to end: how to open, how to walk them through the submission, every number in Q1, Q2 and Q3, and the questions they are likely to ask, with answers.

0. How to open, and how to walk them through it

60-second opener (say this first): "I treated all three tasks as one brief: help YourDOST reach the people who need it, with the data honest and the message calm. In Q1 I cleaned the parent survey, ran the statistics in Numiqo, and found that parents fear gaming more than they understand it. Fear goes with fights at home, rules don't reduce them, and curiosity does. I turned that into an infographic and a 5-slide carousel. In Q2 I made 10 original social posts on one positioning line: a confidential expert who is as easy to reach as a friend. There are 4 videos, 2 carousels and 4 single images, aimed at corporates, students and professionals. In Q3 I owned the P&L of the Founders Program and built a 10-slide pitch for VCs and incubators. The founder pays ₹6,000 to ₹12,000 a program, the fund pays nothing, and the ask is one introduction."

The submission, page by page (24-page "00 START HERE")

Pages	What is there	What to say while showing it
1	Cover: three questions, one document	"Everything is in one place, images side by side. Separate files are attached too."
2	Where to find everything	Q1 pages 3–5, Q2 pages 6–13, Q3 pages 14–24, and the online links.
3	Q1 headline + infographic + big Google Sheet link	The one-line answer, then the workbook link: "every number traces to the survey rows".
4–5	Q1 carousel, 3 slides then 2 slides + link tile	The same story, one step per slide.
6	Q2 overview: positioning line, formats, audiences, the 1–10 list	One line behind all ten posts.
7	The 4 videos (tap to watch)	Hook in the first 2 seconds, then each one in turn.
8–11	Carousels: "Select all squares" (3+3), "Ask your counsellor" (3+3)	The corporate B2B story.
12–13	Single images, 2 per page	HR, AI anxiety, heartbreak, stress and smoking.
14	Q3 title page	"I wrote this as the P&L owner."
15–24	The 10-slide pitch deck	Use the slide-by-slide script in section 3.

Upload files: 00 START HERE (PDF or PPT), Q1_Infographic_and_Carousel.pdf, Q1_Insights_Workbook.xlsx (the "Jamun" Google Sheet), Q2_All_10_Posts.zip, Q3 deck. There is also one PPT per assignment (Q1, Q2, Q3).

1. Q1: Data analysis and insights (parents and online gaming)

The question: What meaningful insights can we derive from the survey data about parents' perceptions of online gaming, and how can we communicate them effectively to a wider audience? Then convert it into a social-media-ready infographic.

> **One-line answer:** Parents fear online gaming more than they understand it. Worry and family fights rise together, and more rules did not mean fewer fights. What helped was curiosity: parents who understand why their child plays feel strain less often. So we speak to parents with calm and one small action, not with fear.

1.1 The data and how I cleaned it

- **Source:** YourDOST parent survey (Google Form), **1–3 Dec 2020**, **100 responses**, **37 questions**.
- **Duplicate:** row 21 was an exact copy of row 18, with every answer identical, sent 9 minutes later. I removed it, leaving **99 unique** responses.
- **The base:** parents who answered "No" to Q1 ("Does your kid play online games?") never saw the rest of the form. So **66 parents** (Yes or Sometimes) answered everything, and every % is out of 66. Reach: 66 of 99 = **2 in 3 (67%)** say their kids play.
- **Grouping:** the scales are No / Low / Medium / High. I count **Medium + High** as "worried" or "feels the impact", because Low is a passing thought. True/False answers are shown as Yes/No. "Rules used" is how many of the 6 listed rules a parent ticked (certain days, certain times, fixed duration, no gaming in exams, certain games only, spending cap).
- **Scores:** No = 0, Low = 1, Medium = 2, High = 3. The **fear score** is the average of the 5 fear items; the **family impact score** is the average of the 3 impact items (frustration, arguments, strain).
- **Checks:** every number is a live formula in the sheet (tab 3) on the clean data (tab 5), and I cross-checked the numbers in Python.
- **Tool: Numiqo** (numiqo.com), an online statistics package, at significance level $\alpha = 0.05$.

Workbook tabs ("Jamun"): 1 Read Me · 2 Numiqo Analysis (the centre of the work) · 3 Insights & Maths · 4 Colour Code · 5 Clean Data (66) · 6 Why This Story.

1.2 Descriptive analysis: how the 66 parents answered

Item	No	Low	Med	High	Med+High	%	Mean (0–3)	Used as
Fear: addiction	0	4	25	37	62	**94%**	2.50	94% hook. No parent said "no fear". 56% (37/66) have High fear
Fear: grades	2	4	26	34	60	**91%**	2.39	Other worries #1
Fear: unsuitable content	0	8	31	27	58	**88%**	2.29	Other worries
Fear: health	3	8	27	28	55	**83%**	2.21	Other worries
Fear: aggressive behaviour	5	9	31	21	52	**79%**	2.03	Lowest fear

Impact: frustration at home	6	18	27	15	42	**64%**	1.77	"6 in 10"
Impact: arguments at home	10	19	23	14	37	**56%**	1.62	Loop step
Impact: strain in parent–child bond	13	17	21	15	36	**55%**	1.58	"1 in 2"

Other key counts: **97%** (64/66) say rules are necessary; **Half (52%, 34/66)** have never played games with their kids; **1 in 5 (18%, 12/66)** use none of the 6 rules. Rounding on the design: 6 in 10 = 64%, 1 in 2 = 55%, Half = 52%, 2 in 3 = 67%.

1.3 Quantitative analysis

Scores (n = 66)

Score	Mean	SD	Median	Min–Max	Meaning
Fear score (0–3)	2.28	0.56	2.4	0.4–3.0	Between Medium and High fear
Family impact (0–3)	1.66	0.91	1.83	0–3	Lower than fear, and more spread out
Rules used (0–6)	3.05	2.05	3.5	0–6	Most homes use several rules; some use none

Spearman correlations (rank-based, because the data are ordinal scales)

Pair	ρ	p	Verdict
Fear score × family impact	**0.58**	<0.001	**Strong, significant**: the strongest link in the data
Rules used × family impact	0.06	0.635	No link: more rules do not go with less conflict
Rules used × fear score	0.04	0.770	No link: rules don't lower fear either
How often kids play × family impact	0.17	0.176	Weak, not significant: gaming time isn't what drives conflict

Group comparisons

Comparison	Test	Result	p	Verdict
Fear: has played games vs never	Mann-Whitney U = 343.5	2.18 (n=41) vs 2.46 (n=25)	0.025	**Significant**
Family impact: understands why child plays vs not	Mann-Whitney U = 253.5	1.56 (n=52) vs 2.02 (n=14)	0.082	Borderline
Family impact by rules group 0–1 / 2–3 / 4–6	Kruskal-Wallis H = 2.80	1.63 (17) / 1.98 (16) / 1.52 (33)	0.247	Not significant: no pattern (1.6 → 2.0 → 1.5)
Family impact: played with kids vs never	Mann-Whitney U = 556.5	1.69 (32) vs 1.63 (34)	0.876	Not significant

1.4 Seven chi-square tests of independence

Variables	χ^2	df	p	Fisher p	Cramér's V	Numbers	Meaning
Understands why child plays × strain	4.14	1	**0.042**	0.068	0.25	25/52 = 48% vs 11/14 = 79%	"The way out". Significant on χ^2, borderline on Fisher (one group is only 14), so moderate evidence

Has played games myself × High addiction fear	6.50	1	**0.011**	0.012	0.31	18/41 = 44% vs 19/25 = 76%	**The clearest result.** Supports "get curious"
Rules group × arguments	3.17	2	0.205	—	0.22	47% / 75% / 52%	No link: "more rules didn't mean fewer fights"
High addiction fear × strain	3.62	1	0.057	0.082	0.23	24/37 = 65% vs 12/29 = 41%	Borderline; supports the loop (worry → conflict)
Played with kids × strain	0.07	1	0.787	0.810	0.03	56% vs 53%	Playing together alone isn't the fix, so the card asks curious questions
How often kids play × frustration	0.29	1	0.587	0.599	0.07	66% vs 59%	The amount of gaming is not the problem
Mother vs father × High addiction fear	0.56	1	0.453	0.607	0.09	60% vs 50%	Both parents worry alike, so the message speaks to both

Pearson χ^2 without continuity correction. Fisher's exact test is shown for 2×2 tables because some groups are small. Cramér's V: 0.1 small, 0.3 medium, 0.5 large.

1.5 What the tests told me (the five findings)

1. **Fear, not gaming time, goes with conflict:** $\rho = 0.58$ vs 0.17 for how often kids play.
2. **More rules did not mean fewer fights:** rules × arguments χ^2 $p = 0.21$; rules × impact $\rho = 0.06$; Kruskal-Wallis $p = 0.25$. Yet 97% say rules are needed.
3. **Curiosity is the way out:** understanding why the child plays goes with strain of 48% vs 79% ($p = 0.04$). Parents who have played games have high addiction fear 44% vs 76% ($p = 0.01$) and a fear score of 2.18 vs 2.46.
4. **Playing together is a start, not the fix:** co-play × strain $p = 0.79$, so the design gives three curious questions, not "just play with them".
5. **Honest limits:** 66 parents; not a random sample (clusters in Kolkata and Bangalore; 64% mothers, 42 of 66); data from Dec 2020. Every result is a link, not a cause. I say "goes with", never "causes".

1.6 From insight to design (the infographic and the 5-slide carousel)

Rule for what made it onto the design: it had to be (1) true in the data, (2) not obvious, and (3) something YourDOST can act on.

Slide	Content	Numbers
1 Hook	"Just 5 more minutes!" They're gaming again. You're worried again. You're not alone.	94% worry their child could get hooked
2 How it feels at home	Frustration and strain, "That doesn't make anyone a bad parent"	6 in 10 (64%) · 1 in 2 (55%)
3 Other big worries	The ranked fears	Grades 91 · Content 88 · Health 83 · Aggression 79
4 The loop	Worry → more rules → arguments → strain; "More rules didn't mean fewer fights"	94% → 97% → 56% → 55%
5 The way out + action	"What helped wasn't more control. It was getting curious." Try tonight, for 10 minutes: "What do you love about this game?" · "Can you teach me one level?" · "What makes it hard to stop sometimes?" → Talk to a YourDOST expert	48% vs 79% feel strain · Half have never played with their kids

Why calm, not scary: fear goes with conflict at home, so a scary campaign could feed the very problem. The design names the worry, normalises it, then gives one small, kind action. It speaks like a "dost" (friend): "You're not alone", "Try this tonight".

Colours (tab 4): deep indigo #2F2663 (trust; headlines, CTA), purple #7F64BA (care; loop arrows), lavender #E5DAFF (soft, safe), YourDOST yellow #FFD225 (brand, optimism), soft yellow #FFE582 (hope, key numbers), peach #FFE4D1 (the parent–child bond), orange #F5924D (a gentle alert, deliberately not panic red). Format: 1080 × 1350 (4:5). The source line, the base of 66 and "associations, not cause" are printed on the image.

1.7 How to take it to a wider audience

- **Format:** one feed post (the infographic) plus a 5-slide carousel, one step per slide, linked by a yellow line and swipe hints.
- **Funnel (AIDA):** Attention: the 94% hook → Interest: the loop → Desire: "curiosity breaks the loop" → Action: try tonight, then talk to an expert.
- **Audiences:** worried parents (mothers of 6–12-year-olds first), fathers, schools (parent workshops), employers and HR (working parents), media (a press note).
- **Channels:** Instagram feed and carousel, WhatsApp parent groups (where parents already talk about this), LinkedIn for HR and schools, YourDOST's corporate and campus partners.
- **Measure:** reach and saves → quiz or workshop sign-ups → expert bookings. A/B test the hook: "You're not alone" vs "More rules didn't mean fewer fights". A new survey wave would refresh the 2020 data.

1.8 Likely Q1 questions

Why is the base 66 and not 100?

One exact duplicate came out, leaving 99. Parents who said their kids don't play never saw the other questions (form logic), so the 66 who answered everything are the base. Using 99 would understate every %.

Why Medium + High?

Low is a passing thought; Medium and High are a real worry. I also report High alone: addiction fear is 56% High. I chose the definition before looking at results, and I use it the same way everywhere.

Why Spearman and Mann-Whitney, not Pearson and t-tests?

The answers are ordinal (No/Low/Medium/High), and n is small, so I used rank-based, non-parametric tests that don't assume normality.

Is 48% vs 79% really significant?

χ^2 $p = 0.042$, but Fisher's exact $p = 0.068$ because only 14 parents don't understand why their child plays. So I call it moderate evidence. The stronger support is "played games → less high fear" ($p = 0.011$ on both χ^2 and Fisher, $V = 0.31$).

Did you show causation?

No. These are associations from one cross-sectional, non-random survey. The design says "goes with", and the disclaimer is printed on the image.

What's the most surprising insight?

97% believe in rules, but rules show no link to fewer fights ($\rho = 0.06$), while fear shows the strongest link ($\rho = 0.58$). The problem is the parent's fear, not the screen time.

What would you do next?

Run a new survey wave with a larger, random sample across cities; A/B test the two hooks; track saves, then sign-ups, then bookings; and build a "Gaming Parent" quiz plus a school parent workshop.

2. Q2: 10 social media posts

> **Positioning line behind all ten:** YourDOST is a confidential expert who is as easy to reach as a friend, by chat, call or video, 24/7.

Formats: 4 videos, 2 carousels, 4 single images, each 1–2 lines, English only, with the logo on every slide. **Audiences (STP):** corporate buyers (HR, managers, CHROs, employees: B2B, which is YourDOST's revenue engine), students (including top B-schools and IITs), young professionals, high achievers, plus a festive moment (Diwali). **Engagement:** every post ends on an action: send it to someone, tag HR, save it, or answer in the comments. In replies, anyone who sounds in crisis gets Tele MANAS 14416 (free, 24/7), a DM, and a flag to the clinical team.

#	Post	Hook	For	Why it works
1	Reel, 17 s: "Watch her face when she picks up"	A student wipes her tears, smiles, tells her mother "Everything's fine, really" the night before placements, then lies back alone	Students at top B-schools and IITs, away from home	Every student has made that call. Made with a Veo video, ElevenLabs piano music, hostel-night sound and an ElevenLabs voiceover
2	Reel, 17.4 s: Diwali	"The house is ready for Diwali. Are you?"	Everyone celebrating	Real (CC0) Diwali photos, original tanpura and santoor music; the diya at the end is a gentle self check-in
3	Reel, 27 s: Inner captions	"We switched on inner captions in today's stand-up."	Corporate teams, managers, HR	An original format: video-call captions show what each person thinks under what they said ("good"). Each colleague has their own voice; the thoughts play as whispers, panned to where they sit on screen
4	Reel, 17.5 s: Everest	"Even Everest climbers take rest days."	High achievers, hustle culture	An expedition chart (up, down, rest, repeat) vs a "no rest days" line that crashes into burnout. Everest is 8,849 m; expeditions take about 6 weeks. Engagement: "When was your last real rest day?"
5	Carousel, 6: "Select all squares with a colleague who's struggling"	A CAPTCHA no one can solve → "Are you sure? Look again." → every square is ticked	Corporate managers, HR, CHROs (B2B)	Everyone has solved a CAPTCHA. The happy team photo hides struggle (panic attack, a dad in the ICU, layoff fear). Stat: **8 in 10** employees in India reported a mental-health concern in the past year; it costs employers about **₹1.1 lakh crore** a year (Deloitte 2022). Close: "You can't spot it. So make it safe to say." Send it to your HR head

6	Carousel, 6: "Your company offers counselling. Here's everything you were too awkward to ask."	Will my manager find out? (No: confidential) · Do I need a big problem? (No) · Can I talk in my own language? (Yes, 20+ Indian languages) · What if I don't want a video call? (Chat, audio or video; **57.88%** of post-pandemic sessions were chat) · Check if you already have access	Employees at companies that offer YourDOST	Removes the barriers to using a benefit the company already pays for, which drives utilisation, which is what B2B renewals rest on
7	Image: "Your best employee isn't quiet. She's quietly updating her résumé."	"Burnout rarely resigns loudly."	HR leaders, CHROs	The twist in line 2 stops the scroll; ends with the B2B ask, confidential support for every employee
8	Image: "Worried about AI and your job?"	"Spend your energy on the inner circle"	Working professionals	A save-worthy control framework: what you control (learn a skill, ask for feedback, sleep, reach out) vs what you don't (how fast AI changes, restructuring, headlines)
9	Image: Heartbreak	"Something funny happened today. I picked up my phone to tell you. Then I remembered."	Young adults	A small, universal moment of loss; "You don't have to carry them alone"
10	Image: Stress and smoking	"You promised yourself that pack was the last." "Just one for the stress"	Young professionals who smoke under stress	Links a habit to the feeling underneath: "Don't smoke the stress away. Talk it out on YourDOST."

How it was made

Brand look taken from YourDOST's own posts: off-white canvas, yellow #F6D25A and lavender cards, purple #5B4A9C, Poppins, and the logo on every slide. Video and voice were made with the **ElevenLabs** creative suite on a 40,000-credit budget: about 24,200 credits used, each model priced before running, single takes, and cheap stills checked before animating.

Tools by job: Seedream and Krea for stills, Veo 3.1 Lite for video, ElevenLabs v3 voices, Music and Sound Effects. The brand UI layers were built in HTML and composited in ffmpeg, with audio normalised to about −14 LUFS for Instagram.

Likely Q2 questions

How did you choose the segments?

STP. B2B corporate is YourDOST's core revenue, so two corporate posts target the buyer (HR) and two target the user (employees). Students and young professionals are the largest individual segments. High achievers and the Diwali moment widen reach.

How would you measure success?

Saves and shares over likes, since they signal real value; comments on the question posts; profile visits and link clicks; and for B2B posts, demo or HR enquiries. Post at the listed times, test hooks, and double down on formats that are saved.

Why are these original?

Formats borrowed from everyday UI: a CAPTCHA, live captions, an expedition chart, a phone notification. Each one makes the point without saying "mental health" in the hook, which lowers stigma.

What about safety?

The tone is calm, not alarming. Crisis replies go to Tele MANAS 14416 and the clinical team. Stats carry a source line, and names and figures inside the mock UIs are illustrative.

3. Q3: Founders Program pitch deck (you are the P&L owner)

> **The pitch in one breath:** A private coach for every founder, chosen and paid for by the founder (₹1,000–1,500 a week), with the fund paying ₹0. The fund makes one introduction, lists us as a perk with 10% off, and gives us one free workshop; in 90 days it gets a report. ₹414 Cr need, ₹42 Cr reachable through partners, ₹99 L revenue by Year 3 at EBITDA +₹5 L.

Slide-by-slide script

Slide 1: "You backed the founder. Who backs them?"

Open on the photo: 11:47 pm, payroll on Friday, board meeting on Monday. Every investor has a founder like this. A private coach founders choose for themselves; the fund simply opens the door.

Slide 2: The program in 30 seconds

A coach for stress, loneliness and co-founder fights. Vision: every founder has a coach, just as every founder has a CA. **Stage:** already running, used by Upekkha and NSRCEL (IIM Bangalore) founders. **Traction:** 250+ founders coached. **Price:** ₹1,000–1,500 a week, paid by the founder. **Ask:** one introduction, then review at 90 days.

Slide 3: The problem

- **49%** of entrepreneurs have lived with a mental-health condition (Freeman et al. 2019).
- **42.9%** of Indian founders score low on wellbeing (WHO-5), and only **15.1%** of the startup ecosystem ever gets professional help (Merak Ventures, State of Mind, 823 respondents).
- **57%** of early-stage founders feel well vs **74%** of founders with six-plus years (YourDOST Emotional Wellbeing of Entrepreneurs study 2024, with INK, TiE, Upekkha and NSRCEL).
- Co-founder conflict is behind **65%** of failed high-potential startups (Noam Wasserman, HBS, about 10,000 founders).
- **Why now:** Indian tech funding fell **17%** to US$10.5 bn in 2025 (Tracxn), so founders wait longer to raise. Poor mental health costs Indian employers about **US$14 bn** a year (Deloitte 2022). US investors such as Freestyle Capital began paying for founder therapy in **2020** (Axios).

Slide 4: The solution

Four steps: **Assess** (week 0, a 5-minute WHO-5 wellbeing check) → **Match** (a dedicated coach within 48 hours) → **Talk** (regular 40-minute calls, 4, 6 or 8 by plan, with worksheets in between) → **Measure** (periodic progress checks; psychologists and psychiatrists on call). Topics: co-founder conflict, stress and anxiety, negative thoughts, focus, relationships, confidence.

Trust design: the fund pays ₹0 and opens the door (one intro, a 10% perk). The founder chooses, pays privately and owns it. Only an anonymous, opt-in summary goes back to the fund, never names or notes. It is not a crisis line; emergencies are routed to 24×7 helplines.

Slide 5: The market (bottom-up and top-down)

Step	Maths	Result
Spend per founder	Average program ₹7,700 before GST (mix of ₹6,000 / ₹9,600 / ₹12,000) × 1.4 programs a year	**₹10,800 a year**
Active startups	1,97,692 DPIIT-recognised − 6,385 closed	1.91 lakh

Founders	× 2 per startup	3.83 lakh
TAM	3.83 lakh × ₹10,800	**₹414 Cr**
Reachable	351 SEBI Cat-I AIFs × 25 portfolio cos × 2 = 17,550 VC-backed founders; 8.2% of startups incubated = 31,374; less 20% overlap (assumed)	39,139 founders
SAM	39,139 × ₹10,800	**₹42 Cr**
SOM (Year 3)	80 partners × 60 founders reached × 12% + 400 direct = 976 founders	**₹1.0 Cr** (2.5% of SAM)
Top-down TAM	3.83 lakh × 42.9% low wellbeing × 84.9% not getting help = 1.39 lakh × ₹10,800	₹151 Cr
Top-down SAM / SOM	14,255 reachable → ₹15 Cr; 7% by Year 3 (assumed)	₹1.1 Cr (about 1,000 founders)
Beyond founders	21 lakh+ startup employees × ₹75 a month × 12	₹189 Cr team-wellness upsell

Why the two methods differ: top-down counts only founders with an unmet need. The 976-founder plan is about 7% of that reachable need. Sources: DPIIT via Lok Sabha (Dec 2025), SEBI data via PMS Bazaar (2026), India Incubator Kaleidoscope 2024, Merak Ventures 2026.

Slide 6: Alternatives ("The real competitor is doing nothing")

Alternative	Why used	Falls short	Our difference
Doing nothing	Free, private, no time needed	Only 15.1% seek help, so problems surface late	A coach to call before it's a crisis
Peer networks (TiE, EO, YPO)	Trusted, founder to founder	Not clinical; hard to be fully open with peers	Private, trained, clinically backed
Therapy apps (Amaha, Lissun, Wysa)	Qualified, easy	Built for everyone	Made for founders and co-founder issues
Employee programs (Optum, 1to1help)	Free through the company	Made for employees; founders rarely use them	Built for and owned by the founder
Founder coaches (Reboot in the US, Indian exec coaches)	Built for CEOs	₹20,000–₹1 lakh a session; Reboot is US-only	About ₹1,500 a call, psychologists on call

Parity: qualified experts, private 1:1, phone, chat and video. **Difference:** founder-specific, founder-owned, a structured program (not a one-off session), clinical escalation. Abroad, investors already pay: Freestyle (2020), Felicis, Starting Line, Balderton; Reboot (Jerry Colonna, 2014) and Cerevity are US-only.

HHI (market concentration): FY25 revenue of the four players that disclose it is Amaha ₹27.6 Cr, YourDOST ₹19.9 Cr, Lissun ₹5.1 Cr, MindPeers ₹4.2 Cr, ₹56.8 Cr in total. Among those four, HHI is **3,720**, highly concentrated (3,047 on MindPeers' alternative figure). Across the whole ₹150 Cr+ market it falls to about **530**, unconcentrated (US DOJ/FTC: under 1,500 unconcentrated, over 2,500 highly concentrated). The market is fragmented: 262 active players, 37 funded, and no founder-only leader. *HHI = the sum of squared market shares in %.*

Slide 7: Economics

Item	Number
Plans (incl. GST, published Founders page)	Plan 1: ₹1,500/wk × 4 wks = ₹6,000, 4 calls · **Plan 2 (recommended):** ₹1,200/wk × 8 wks = ₹9,600, 6 calls, 20% off · Plan 3: ₹1,000/wk × 12 wks = ₹12,000, 8 calls, 33% off
Who pays	The founder; funds pay ₹0; partner founders get 10% off

Repeat	About 1.4 programs a year (40% buy a second); founders stay about 1.5 years
Cost to serve	About ₹3,700 a program: coach ₹600 a 40-minute call, 90% of calls used, ₹150 materials and platform, ₹200 matching and support, 2% payments
Per paying founder, Year 3 (before GST, net of perk)	Revenue ₹10,182 − coaches ₹4,460 − materials ₹210 − support ₹280 − payments ₹204 = **gross profit ₹5,028 (about 50%)** − acquisition ₹1,230 = **contribution ₹3,798**
CAC	₹3,300 (Year 1) → ₹1,230 (Year 3)
LTV	About ₹7,500 over 1.5 years → LTV:CAC **2.3×** (Year 1), **6.1×** (Year 3)
Price anchor	About ₹1,500 a 40-minute call ≈ YourDOST retail sessions (₹1,299–1,599), **13× cheaper** than an executive coach (₹20,000+, The Ken)

3-year plan	Year 1	Year 2	Year 3
Partners	15	40	80
Conversion (of 60 founders reached per partner)	8%	10%	12%
Direct founders	80	200	400
Paying founders	152 (15×60×8% = 72 + 80)	440 (240 + 200)	976 (576 + 400)
Revenue (₹ L)	15.7	45.0	99.4
Gross profit (₹ L)	7.8	22.3	49.1
Opex (₹ L): lean team on the existing platform + 10% overhead	18.6	28.5	43.9
EBITDA (₹ L)	**−10.7**	**−6.2**	**+5.1**

Slide 8: Traction and learning

YourDOST revenue grew from **₹2.28 Cr (FY18) to ₹19.9 Cr (FY25), 8.7×**, profitable in FY25 (net profit ₹33.6 lakh) with no debt (MCA via Tracxn). **30 lakh+** sessions, **500+** organisations. Program proof: 250+ founders with Upekkha and NSRCEL, including founders of SendX, iZooto, Appknox and Stoned Santa. Quote: "The lows now feel a bit more shallow" (Mayank, SendX).

Learned → next: founders took it to their teams → offer team wellness to portfolio companies; co-founder conflict is a top theme → add joint co-founder sessions; founders hesitate → partner intro, 10% perk, anonymous summary. **Still to prove:** paid conversion at scale (we assume 8–12%). **Next test:** a 90-day pilot with 3 partners measuring reach, sign-ups and completion.

Slide 9: Team

Founded **2014** by Richa Singh, Puneet Manuja, Prakhar Verma and Satyajeet Nandekar (IIM Bangalore and McKinsey backgrounds). 30 lakh+ sessions by psychologists, counsellors and psychiatrists, in 20+ Indian languages, 24/7. 500+ organisations; backed by Elevation Capital. Program owner: **Chethan N**. Quotes: Mayank (SendX), Shashank Shekhar (Stoned Santa, via NSRCEL: "If it was not for NSRCEL I would not have tried therapy again"), Prasanna (Upekkha: "Some of them rolled it out to their employees as well").

Slide 10: The ask

1) Send one email introducing us to your founders. 2) List us as a founder benefit with 10% off. 3) Give us one hour for a free workshop on founder stress. In 90 days: workshop on day 14 → plans start by day 30 → a simple report on day 90 (reach, sign-ups, completion, anonymous wellbeing). If founders don't value it, nobody has spent a rupee. Close: "Because no founder should have to face the hard days alone."

Likely Q3 questions

Why should the founder pay, not the fund?

Ownership and trust. Founders won't open up about a fund-paid program the fund might monitor. Founder-pays also means zero budget friction for the fund, so the yes is easy. The fund still adds value through the intro and the 10% perk. Later, funds can sponsor it as a portfolio benefit; that is upside, not the base case.

Is 8–12% conversion realistic?

It is the main unproven assumption, and I say so on slide 8. That is why the next step is a 90-day, 3-partner pilot that measures it before scaling. The break-even plan needs about 12% by Year 3; at 8% the program still covers gross costs, just later.

How did you get ₹10,800?

A ₹7,700 average program before GST (a blend of the three published plans) × 1.4 programs a year, assuming 40% of founders buy a second program.

Why is TAM ₹414 Cr bottom-up but ₹151 Cr top-down?

They measure different things. Bottom-up counts every founder at the spend level; top-down counts only founders with low wellbeing who aren't getting help. Either way, the Year-3 plan (₹1 Cr) is a small, believable share.

Why not just use therapy apps or EAPs?

They're built for individuals or employees. Founders aren't employees of an EAP-covered company, and co-founder conflict and investor pressure need a founder-specific structure. Exec coaches cost 13× more and have no clinical back-up.

What's the biggest risk?

Low conversion and founder reluctance. Mitigations: partner-led trust, the free workshop as the entry point, anonymity, and a short 4-week plan as a low-commitment start. Also coach supply and quality: we reuse YourDOST's vetted expert pool.

What is HHI and why show it?

The Herfindahl-Hirschman Index, the sum of squared market shares. About 530 across the market means it is fragmented, with no founder-only leader, so there is room for a category-defining program.

What would you do in the first 90 days as owner?

Sign 3 pilot partners (for example Upekkha, NSRCEL and one VC); run the workshops; track reach → sign-ups → completion → repeat; add joint co-founder sessions; then fix the pricing mix and CAC before scaling to 15 partners.

3B. Say it simply: every number, explained like to a 20–25-year-old

Use these lines word for word if you get stuck. Each is: **what it is → what it means → why it matters**.

Q1: the statistics in plain English

Term / number	Say it like this
100 → 99 → 66	"100 parents filled the form. One person submitted twice, so I deleted the copy: 99. Only parents whose kids actually play games got the full questions, and that's 66. So every % is out of 66 people."
Medium + High	"The options were No, Low, Medium, High. I counted Medium and High as 'really worried', because 'Low' is like a passing thought."
94%	"Out of 66 parents, 62 are seriously worried their kid could get addicted. And not one parent said 'no worry'."
6 in 10 / 1 in 2	"64% say gaming causes frustration at home. 55%, basically half, say it hurts their relationship with their child. So it's a family problem, not just a kid problem."
91 / 88 / 83 / 79	"Next worries: marks, wrong content, health, and last, violence. So people fear 'my kid is wasting time and failing', not 'my kid will become violent'."
97% want rules	"Almost everyone thinks rules are the answer."
Score 0–3	"I turned answers into numbers: No 0, Low 1, Medium 2, High 3, and averaged them per parent. Fear averages 2.28 (between Medium and High); family impact averages 1.66 (lower)."
Correlation (Spearman ρ)	"Correlation tells you if two things go up together. It runs from 0 (no link) to 1 (perfect link). I used Spearman because the answers are rankings (Low/Medium/High), not exact measurements."
ρ = 0.58	"Fear and fights at home move together strongly. That's the biggest link in the whole survey: the more a parent fears gaming, the more fights there are."
ρ = 0.06	"Number of rules vs fights: basically zero. Homes with lots of rules fight just as much as homes with few. So more control didn't fix it."
ρ = 0.17	"How much the kid plays barely relates to fights. It's the parent's fear, not the screen time."
p-value	"The p-value is the chance you'd see a result this strong by pure luck. Below 0.05 (5%) we trust it. Between 0.05 and 0.10 is 'maybe'. Above that, could easily be luck."
Chi-square (χ^2)	"Chi-square checks if two yes/no groups really differ, for example 'understands why kid plays' vs 'feels strain'. Is the difference real or random?"
48% vs 79% (p 0.042)	"Parents who understand why their kid plays: about half feel strain. Parents who don't: 8 in 10 feel strain. The test says it's probably real (p 0.04). But only 14 parents were in the 'don't understand' group, so a stricter test (Fisher) gives 0.068. So I call it moderate evidence, not proof."
44% vs 76% (p 0.011)	"Parents who've played games themselves: 44% have high addiction fear. Parents who never played: 76%. This is the strongest result, it passes every test. Trying the game yourself reduces fear."
Fisher's exact test	"A stricter version of chi-square for small groups. I showed both so nobody can say I picked the nicer number."
Mann-Whitney / Kruskal-Wallis	"Tests that compare averages between two groups (Mann-Whitney) or three groups (Kruskal-Wallis) when data is rankings. Example: fear 2.18 for parents who played vs 2.46 for those who never did, and it's real (p 0.025)."
1.6 / 2.0 / 1.5	"Fights score for parents with 0–1 rules, 2–3 rules and 4–6 rules. It goes up and then down. No pattern. More rules didn't mean fewer fights."

Cramér's V	"How big the difference is, from 0 to 1. 0.3 is medium. My best result is 0.31."
Correlation ≠ causation	"I can say these things go together. I can't say one causes the other. So I write 'goes with', never 'causes'."
Limits	"66 parents, mostly from Kolkata and Bangalore, 64% mothers, from 2020. Good for direction, not a national fact. Next step: a bigger, fresh survey."

The Q1 story in 4 sentences: "Almost every parent is scared of gaming addiction. That fear goes with fights at home, and adding rules doesn't reduce the fights. What does help is curiosity: parents who understand or try the game worry less and feel closer to their kid. So YourDOST should speak calmly and give one small action, 'ask your kid what they love about the game', then offer an expert."

Q3: the pitch deck numbers in plain English

Term / number	Say it like this
The model	"The founder buys a coaching plan for themselves. The VC fund pays nothing, it just introduces us. Like a gym membership the founder chooses, recommended by their investor."
₹6,000 / ₹9,600 / ₹12,000	"Three plans: 4, 8 or 12 weeks. That's ₹1,500, ₹1,200 or ₹1,000 a week. About ₹1,500 per 40-minute call."
13× cheaper	"An executive coach costs ₹20,000+ a session. We're ₹1,500. So 13 times cheaper, and we have psychologists on call."
₹10,800 a year	"Average plan is ₹7,700 before tax. About 4 in 10 founders buy a second plan, so on average 1.4 plans a year: 7,700 × 1.4 ≈ ₹10,800 per founder per year."
TAM ₹414 Cr	"TAM is the total pie if every possible customer bought. India has about 1.91 lakh active startups, about 2 founders each, so 3.83 lakh founders × ₹10,800 = ₹414 crore."
SAM ₹42 Cr	"SAM is the part we can actually reach. We sell through VC funds and incubators, which reach about 39,000 founders × ₹10,800 = ₹42 crore."
SOM ₹1 Cr	"SOM is what we realistically win in 3 years: 80 partners × 60 founders each × 12% who buy, plus 400 who come directly = 976 founders, about ₹1 crore."
Top-down ₹151 Cr	"A second way to check: only count founders who are struggling and not getting help: 3.83 lakh × 42.9% × 84.9% ≈ 1.39 lakh founders, about ₹151 crore. Two methods, same conclusion: big need, and my target is small and realistic."
Gross margin about 50%	"From ₹10,182 a founder pays in a year, about ₹5,000 goes to the coach and running costs. We keep about half."
CAC ₹3,300 → ₹1,230	"CAC is what it costs to win one paying customer. It starts at ₹3,300 and falls to ₹1,230 as partners bring founders for us."
Contribution ₹3,798	"After the coach, costs and marketing, we still make about ₹3,800 per founder per year."
LTV ₹7,500 and 6.1×	"LTV is the profit one customer brings over their whole life with us, about ₹7,500 over 1.5 years. In Year 3 that's 6 times what it costs to win them. Anything above 3× is considered healthy."
EBITDA −11 → −6 → +5 lakh	"EBITDA is operating profit. We lose ₹11 lakh in Year 1 while building, ₹6 lakh in Year 2, and make ₹5 lakh in Year 3. It turns profitable in Year 3."
152 → 440 → 976 founders	"Paying founders each year. Year 1: 15 partners × 60 × 8% = 72, plus 80 direct = 152. Year 3: 576 + 400 = 976."
49% · 42.9% · 15.1%	"Half of entrepreneurs have had a mental-health condition. 43% of Indian founders are low on wellbeing. Only 15% ever get help. Huge need, and almost nobody acts on it."

57% vs 74%	"Only 57% of new founders feel well vs 74% of experienced ones. The early years are the hardest."
65%	"Two-thirds of high-potential startups that fail, fail because co-founders fall out. So helping founders is protecting the investment."
HHI 530	"HHI measures if a market is owned by a few big players. Under 1,500 means scattered. Ours is about 530, so lots of small players and no clear leader for founders. That's an opening."
₹2.28 Cr → ₹19.9 Cr (8.7×)	"YourDOST's own revenue grew almost 9 times in 7 years and is profitable. So the platform behind this is real."
The ask	"Three free things from the fund: one email, list us as a perk with 10% off, one hour for a workshop. In 90 days they get a report. If it doesn't work, nobody lost money."

The Q3 story in 4 sentences: "Founders are stressed and rarely get help, and that risks the investor's money. We give each founder a private coach that they choose and pay for, about ₹1,500 a call. The fund pays nothing, just introduces us. It's a ₹414 crore need, we can reach ₹42 crore through partners, and we plan ₹1 crore and profit by Year 3, starting with a 90-day pilot."

4. Numbers to have at the tip of your tongue

Q1	Q2	Q3
100 → 99 → **66** base · Dec 1–3, 2020	4 videos · 2 carousels · 4 images	₹1,000–1,500 a week · ₹6k / ₹9.6k / ₹12k
94% fear addiction (56% High)	8 in 10 employees with a mental-health concern	TAM ₹414 Cr · SAM ₹42 Cr · SOM ₹1.0 Cr
64% frustration · **56%** arguments · **55%** strain	₹1.1 lakh crore cost to employers (Deloitte 2022)	Top-down ₹151 / 15 / 1.1 Cr
Grades 91 · Content 88 · Health 83 · Aggression 79	57.88% of sessions are chat	₹10,800 spend a year · 1.4 programs
Rules necessary **97%**	20+ Indian languages · 24/7	GM about 50% · contribution ₹3,798
ρ fear × impact **0.58** ($p < 0.001$)	Tele MANAS 14416	CAC ₹3,300 → ₹1,230 · LTV about ₹7,500
ρ rules × impact **0.06**	Everest 8,849 m, about 6-week expedition	LTV:CAC 2.3× → 6.1×
ρ play frequency × impact 0.17	About 24,200 of 40,000 ElevenLabs credits used	Revenue ₹16 L / ₹45 L / ₹99 L
Strain 48% vs 79% (p 0.042, Fisher 0.068)		EBITDA −11 / −6 / +5 (₹ L)
High fear 44% vs 76% (p 0.011)		Founders 152 / 440 / 976
Fear 2.18 vs 2.46 (p 0.025)		250+ founders coached · 30 lakh+ sessions · 500+ orgs
Impact by rules 1.6 / 2.0 / 1.5 (p 0.25)		YourDOST revenue ₹2.28 → ₹19.9 Cr (8.7×)
52% never played with their kids		49% · 42.9% · 15.1% · 57 vs 74% · 65%
64% mothers		HHI 3,720 (top 4) vs about 530 (market)

Be upfront about these (it builds trust): Q1 is a small, non-random, 2020 sample, so it shows links, not causes. Q3's conversion (8–12%) and overlap (20%) are assumptions, labelled as such, to be tested in the pilot. Q2's names and figures inside the mock UIs are illustrative. If asked what you'd improve: a fresh survey wave, a paid pilot, and post-level performance data.

Close the interview with: "Across all three, I tried to do what an EIR does: find the real insight in the data, turn it into something people actually engage with, and own the numbers behind a business decision. I'd love to run the 90-day founders pilot first."
