PRESENTER'S GUIDE · 2 NOV 2026

Movers Signal

Leadership seats before the mandate. How it works, why it is built this way, and how to explain it in the room.

53	50	8	32
verified seats	NSE and BSE filings	practices	with no permanent successor

Understand it
Parts 1 to 4: the idea, where every fact comes from, how it is checked, and how the pieces connect.

Defend it
Parts 5 to 7: the priority score and its weights, the derived rules, the hypotheses and guardrails.

Present it
Parts 8 to 11: the screens, a click-by-click demo script, likely questions, limits and a cheat sheet.

Filings dated 4 Aug 2026 to 2 Nov 2026. Every number in this guide is read from the project's data.

Independent prototype built from public filings. Not affiliated with Positive Moves.

CONTENTS

What is in this guide

01 **The idea in one minute** 3
The problem, the signal, the pitch, and what it is not

02 **Where every fact comes from** 4
Sources, how filings were found, the funnel and what a record holds

03 **How we know it is right** 6
Three text engines, the corrections, the rejections and the automatic checks

04 **The connections** 8
How one filing becomes a row, a brief and a chart

05 **The priority score** 9
The formula, why each weight, two worked examples, and why it is not a probability

06 **The derived rules** 11
How practice and role level are decided

07 **Hypotheses and guardrails** 12
What the brief suggests, how it is generated, and what it never does

08 **The four screens** 13
What each screen shows and what to point at

09 **The demo script** 15
Seven minutes, click by click, with what to say

10 **Questions you may get** 16
Short, honest answers

11 **Limits, next phase and cheat sheet** 18
What to admit, what comes next, and one page to glance at

The idea in one minute

A retained search firm usually hears about a senior seat once the mandate is being discussed. Movers Signal looks one step earlier: at the moment a listed company tells the stock exchange that a senior leader is leaving, retiring or joining.

The signal

Companies listed in India must disclose changes in their directors, key managerial personnel and senior management to the exchanges under Regulation 30 of SEBI's Listing Regulations. The disclosure is public, dated, and written by the company itself, usually with the effective date and often with the reason and the successor. That makes it the earliest reliable public sign that a senior seat is opening.

What Movers Signal does: four verbs

Read
Collect the NSE and BSE filings on senior leadership changes from the last 90 days and pull out each seat.

Verify
Keep only what the filing states, with page and quote. Re-read every PDF with two independent engines.

Rank
Order the seats with a four-part priority rule that anyone can recompute by hand.

Brief
Give the practice a brief: facts, why now, questions, talent pools and the PINE checks.

THE 30-SECOND PITCH

Every listed company has to tell the exchange when a senior leader leaves or joins. Movers Signal reads those filings, keeps only what the filing actually says, checks every fact against the PDF twice, and ranks the seats a partner should look at first, with a rule anyone can recompute.

Each seat gets a short brief: the facts with their quotes and page links, why it might matter now, the questions to ask, and the checks to run in PINE before anyone reaches out.

What it is not

- **Not a prediction.** The score is a priority rule for ordering attention. It is never called a probability, because there is no outcome data to test it against yet.
- **Not a people database.** No candidates are named, and no phone numbers or e-mail addresses are stored or shown.
- **Not scraped.** No LinkedIn, no paid data, no Positive Moves internal data. Only the companies' own filings.

The numbers to remember

53
verified seats
from 50 filings, 4 Aug 2026 to 2 Nov 2026

32
no permanent successor
60% of seats: none named, interim or unclear

30
CEO, MD and C-suite seats
role level from the filed title

13
effective in the next 45 days
2 Nov 2026 to 17 Dec 2026

Where every fact comes from

Every fact on the site traces back to one PDF that the company filed with NSE or BSE, to a page in it, and to an exact quote of under 15 words.

Sources and window

- **Primary filings only:** the PDF each company filed with NSE or BSE. Of the 53 seats, 35 come from BSE filings and 18 from NSE filings.
- **Window:** filings dated 4 Aug 2026 to 2 Nov 2026, the 90 days up to the data date (2 Nov 2026).
- **Roles:** CEO and MD, the C-suite, business heads, function heads and other named senior management. **Events:** resignation, retirement, removal, end of term, appointment, and other moves.

How the filings were found

NSE's public corporate-announcements feed, plus web searches restricted to the two exchanges' own sites. A search result was only ever a pointer: every PDF was then fetched directly from the exchange archive and read. Reading the PDF caught two search mistakes before any data was taken: a filing labelled as Dr. Reddy's was in fact Ashok Leyland's, and a Bain Capital disclosure linked to Manappuram was in fact about Dhoot Transmission.

Polite access. One honest user agent that names the project, one request at a time with a pause, no cookies, no browser imitation. A block stops the run and writes a list of filings to download by hand into `data/raw/`. No block was bypassed.

The funnel

STAGE	COUNT	WHAT HAPPENED
Documents fetched	109	Candidate filings from the feed and the restricted searches
Screened out at triage	51	No change of seat holder, outside the window, or a text layer that could not be read reliably
Filings reviewed in full	57	50 in the study set plus 7 kept as review tests
Seat records extracted	60	Some filings carry more than one seat
Verified and on the site	53	From 50 filings across all 8 practices
Rejected	7	Each with a written reason (Part 3)

What a record holds: the top seat as an example

FILED FACT **Chief Technology Officer, Laxmi Organic Industries Limited**. Every field carries its page and an exact quote. If the filing does not state something, the field stays empty and says why; that happened 16 times across the 53 seats, for example:

- **KPI Green Energy Limited**, stated reason: This update states no reason; it refers to the company's communication of 11 Aug 2026.
- **PNB MetLife India Insurance Company Limited**, exchange symbol: Debt-listed company: the filing carries no equity trading symbol.
- **PNB MetLife India Insurance Company Limited**, stated reason: This filing states no reason; it refers to an intimation of 13 Jul 2026, outside the window.

FIELD	VALUE	SUPPORTING QUOTE	PAGE
Company	Laxmi Organic Industries Limited	*“For Laxmi Organic Industries Limited”*	1
Exchange symbol	LXCHEM	*“Trading Symbol: LXCHEM”*	1
Person	Salil Mukundan	*“Mr. Salil Mukundan, vide an email dated August 18, 2026 tendered his resignation”*	1
Role title	Chief Technology Officer	*“tendered his resignation as Chief Technology Officer of the Company”*	1
Event	Resignation	*“Mr. Salil Mukundan, vide an email dated August 18, 2026 tendered his resignation”*	1
Filing date	18 Aug 2026	*“August 18, 2026”*	1
Effective date	31 Oct 2026	*“he will be relieved from his duties on October 31, 2026.”*	1
Stated reason	“to pursue an opportunity outside Laxmi in line with his personal aspirations”	*“to pursue an opportunity outside Laxmi in line with his personal aspirations.”*	1
Successor status	Not named	*“the Company does not presently envisage like-for-like replacements for these roles”*	1
Successor source	Not applicable	*No successor is named, so there is no source to classify.*	

The stated reason is shown only as the filing words it (39 of 53 filings state one). Nobody's reason for leaving is ever guessed.

How we know it is right

Accuracy is designed in, not hoped for: a second, independent reading of every PDF; corrections kept in the open; a review step; and automatic checks that fail the build if anything unverified reaches a page.

The seven steps

1. **Fetch and fingerprint**
   Each PDF is downloaded once and its SHA-256 hash recorded, so any later change to the document is detectable.
2. **Read the text**
   Engine A (pdfplumber) turns each page into text. Phone numbers and e-mail addresses are removed from the stored text.
3. **Extract**
   Each field is filled only from the text, with its page and an exact quote under 15 words. A field the filing does not state is stored as empty.
4. **Verify independently**
   Engines B (pypdfium2) and C (poppler) re-read every PDF from scratch. For each field: is the quote on that page, and does the quote support the value? Result: match, mismatch or not found.
5. **Correct in the open**
   Mismatches go to a review queue. Corrections are stored separately from the first pass, each with a reason, then verified again.
6. **Review record by record**
   Each record is approved or rejected beside its source in review.html. A record cannot be marked verified while any mismatch is unexplained.
7. **Publish only what passed**
   The site reads only VERIFIED records, and a build check proves nothing else leaked.

Why three engines

PDF text extraction fails in layout-specific ways: two columns merged into one line, a table row read in the wrong order. Three different parsers rarely fail in the same way, so a quote that all of them find on the cited page is very unlikely to be a reading error.

What the first verification run caught

ISSUE FOUND IN RUN 1	COUNT
Quote spanned two layout columns (address block)	22
Quote not in the independent engines' reading order (table row)	4
Same event filed twice with conflicting dates	2
Possible successor wording in the document	1
Value not fully supported by its quote	2
Filed outside the 90-day window	1

32 issues in run 1 (29 field mismatches, 3 record flags). **26 corrections** were made, and all 26 re-verified as matches in run 2. **1 false alarm** was cleared with a written reason. The other 5 belonged to records that were then rejected.

For the 53 seats on the site: 647 field checks in the final run, 630 matches, 16 confirmed absent (empty fields), 1 cleared at review with a reason.

The 7 rejected records

RECORD	WHY IT WAS REJECTED
`punjab-sind-bank-20261102-general-manager`	The company name is not in the text layer, the annexure profile describes a different person (Santosh Neeraj), and an earlier copy of the same event gives dates a month apart. Facts cannot be stated with confidence.
`punjab-sind-bank-20261102-general-manager-superseded`	Earlier copy of the same event, filed five minutes before a corrected filing; its dates conflict by one month.
`upl-20261102-president-apac-africa-europe`	Reads as the designation of an existing President as Senior Management Personnel; the filing does not show a change of seat holder.
`wockhardt-20261102-cdio-designated-smp`	The existing Chief Digital & Information Officer is designated SMP; no one leaves or joins the seat.
`pfizer-20260727-ed-finance-cfo`	Filed 27 Jul 2026, before the 90-day window opens on 4 Aug 2026.
`banswara-syntex-20261102-coo-garment`	OCR-quality text: the effective date reads '2th November' and the title is incomplete in the text layer.
`akums-20261102-president-operations-designated-smp`	An existing President is designated SMP; no seat change.

Checks that run automatically

- **Link check:** 53 of 53 source PDFs re-downloaded on 2026-11-02: HTTP 200, the same SHA-256 as the first fetch, and all 98 cited pages present. BSE moves new filings to a permanent address after a few days; 2 links already point to the permanent, byte-identical copy and 1 is still pending.
- **Site check** on the built site: no rejected record anywhere (pages, data, scripts); exactly one page per verified seat; every external link is a confirmed source PDF; every headline number recomputed independently and compared; the disclaimer on every page; "probability" only ever as "not a probability"; no e-mail address or phone number.
- **Automated tests** for the score rule, filters, the data and the export, plus lint, type checks and a production build.

Say this openly. Current review decisions are by Claude (AI second reader). A person's sign-off in review.html is still pending. Human decisions override the AI reader as soon as they are exported.

PART 4 · THE CONNECTIONS

The connections

The whole system is one chain. Each step reads only the output of the step before, and each screen element can be traced back to a file and a rule.

1 · SOURCE **Filing PDF** NSE or BSE archive, hashed with SHA-256	2 · TEXT **Page text** Engine A, contact details removed	3 · RECORD **Filed facts** Value + page + quote, or empty	4 · CHECK **Verification** Engines B and C, corrections, review
5 · DERIVE **Rules** Role level, practice, days to effective date	6 · SCORE **Priority** Four components, gate, rank	7 · GENERATE **Hypotheses** Why now, questions, talent pools	8 · SHOW **Four screens** Radar, brief, pulse, method

Where each thing on screen comes from

ON SCREEN	COMES FROM	RULE OR FILE
Company, person, role, dates, reason, successor	The filing, via the verified record	`data/records.json` FILED FACT
Quote and page link	Evidence stored with each field	PDF link opens at `#page=N`
Role level	The filed title	Ordered rules, `config/role_levels.json` DERIVED
Practice	Company's business, or private equity control	`config/practices.json` DERIVED
Priority and rank	Role level, successor, other exits, effective date	`config/score.json`, `lib/score.ts` DERIVED
Status chip	Successor status, plus the gate	Open seat, Interim in seat, Successor unclear, Successor named, Seat filled
Why now, questions, talent pools	The seat's facts and derived fields	`config/hypotheses.json` HYPOTHESIS
Before outreach checks	Positive Moves' own systems	Shown as "Needs PINE access"; never simulated
Radar numbers, Market pulse charts	Counts over the verified seats	`lib/summary.ts`, `lib/pulse.ts` DERIVED
Audit counts on Method	The pipeline's own logs	`data/audit.json`, `AUDIT.md`

One source of truth

The build writes the whole site as one data file (`site-data.json`): every value the four screens show, computed by the same code, from verified records only. The website and the Lovable copy both render that file, so they cannot disagree. Changing a weight in `config/score.json` and rebuilding re-ranks every seat everywhere.

> SAY IT LIKE THIS
>
> *Nothing on the screen is typed in by hand. A fact comes from a filing with its quote; a label like role level or practice comes from a written rule; the priority comes from four published weights; and the brief's suggestions are marked as hypotheses for a partner to test.*

The priority score

Priority = role level + successor status + other exits at the same company + timing, out of 100. It orders a partner's attention. It does not predict anything.

ROLE LEVEL	POINTS
CEO / MD	35
CXO	25
Business head	15
Function head	10
Other SMP	5

SUCCESSOR STATUS	POINTS
Not named	30
Interim	25
Unclear	15
Permanent named	0

OTHER EXITS AT THE SAME COMPANY (LAST 12 MONTHS, THIS DATASET)	POINTS
0	0
1	10
2 or more	15

TIMING OF THE EFFECTIVE DATE	POINTS
Effective in the next 45 days (today counts)	20
Effective in the last 30 days	15
Any other date, or no date stated	5

Why these weights

Role level	The more senior the seat, the rarer the people who can fill it, the longer the search and the more likely a retained firm is hired.
Successor status	No successor named is an open need. An interim holder means the need is still open. A permanent successor means this seat needs no search, although the successor's old seat may now be open.
Other exits at the same company	Several senior exits in a year suggest a team in change, so more than one seat may follow. Counted only inside this dataset.
Timing	A seat that changes hands in the next 45 days, or did in the last 30, is when a conversation is most useful. Older or undated changes get a small base score.

Gate. An appointment that names a permanent successor is shown as "Seat filled" and ranked below every open seat, whatever its score. **Order:** open seats first, then higher priority, then the sooner effective date, then company name.

Worked example 1: the top seat

Chief Technology Officer, Laxmi Organic Industries Limited: 25 + 30 + 10 + 15 = **80**, status Open seat.

COMPONENT	REASON	POINTS
Role level	C-suite (CXO)	25
Successor status	No successor named	30
Other exits at the same company (last 12 months, this dataset)	1 other exit at this company in the dataset	10
Timing of the effective date	Effective 31 Oct 2026, 2 days before 2 Nov 2026	15

Worked example 2: a filled seat

Chief Product Officer, ESDS Software Solution Limited scores 55, more than many open seats, but it is an appointment with a permanent successor, so the gate marks it "Seat filled" and it ranks 44 of 53, below all 43 seats that are not filled.

COMPONENT	REASON	POINTS
Role level	C-suite (CXO)	25
Successor status	Permanent successor named (external)	0
Other exits at the same company (last 12 months, this dataset)	1 other exit at this company in the dataset	10
Timing of the effective date	Effective 2 Nov 2026, the as-of date	20

How the 43 seats that are not filled spread

Priority bands, highest first. Derived from the site data.

Why "priority", never "probability"

There is no outcome data yet: we do not know which of these seats became mandates. Without that, no score can honestly claim accuracy. The weights are a stated judgement, kept in one config file, so they can be argued with and changed. The next phase compares priority with the mandates that actually followed and tunes the weights on that evidence.

> SAY IT LIKE THIS
>
> *The top seat is Chief Technology Officer at Laxmi Organic Industries Limited: a C-suite seat with no successor named, another senior exit at the same company, and an effective date that has just passed. That is 25 + 30 + 10 + 15, so 80 out of 100. Anyone can redo that sum from the brief.*

The derived rules

Two labels are not in the filing and are derived by written rules: which practice a seat belongs to, and how senior the role is. Both are tagged DERIVED wherever they appear.

Practice routing

1. Private Equity when a primary filing shows a private equity fund as a promoter or in joint control of the company.
2. Otherwise, the practice of the company's main line of business.

The private equity rule needs evidence from a primary filing too. In this sample it applies to 2 companies: India Shelter Finance Corporation Limited, Manappuram Finance Limited. For Manappuram Finance Limited, for example:

- “RBI grants all approvals for Bain Capital to acquire joint control of Manappuram Finance” (p.1)
- “joint control with the existing promoters” (p.2)

PRACTICE	COVERS	SEATS
Financial Services	Banks, NBFCs, housing finance, insurers, asset managers and brokers	7
Telecom	Telecom operators, broadband and cable networks, network services and equipment	4
Digital	Internet platforms, online marketplaces and digital-learning businesses	3
Private Equity	Companies where a private equity fund is a promoter or holds joint control	4
Consumer Products & Retail	Foods, beverages, consumer durables and electricals, restaurants, leisure	8
Information Technology	IT services, cloud and data-centre services, managed IT infrastructure	4
Healthcare & Life Sciences	Pharmaceuticals, intermediates, hospitals and diagnostics	7
Industrial & Infrastructure	Manufacturing, chemicals, auto, power, EPC, railways and capital goods	16

Role level

The rules run in order on the lower-cased filed title; the first match wins. Order matters: "Chief Executive Officer - Consumer Business" is a business head, not the company CEO, so that rule runs first.

#	LEVEL	WHEN IT APPLIES
1	**Business head**	CEO of a business unit, not of the company
2	**CEO / MD**	Company CEO or Managing Director
3	**CXO**	C-suite title (Chief … Officer) or an executive whole-time director
4	**Other SMP**	Senior management below function-head level
5	**Function head**	President of a function
6	**Business head**	Leads a business, region or division
7	**Function head**	Leads a function (HR, finance, supply chain, legal, sales and so on)
8	**Other SMP**	Any other named Senior Management Personnel

> SAY IT LIKE THIS
> *Practice and role level are rules, not judgement calls. If a partner disagrees with one, we change the rule in one file and every seat is re-labelled the same way.*

Hypotheses and guardrails

Three sections of each brief are judgements, not facts. They are generated by written rules from the seat's facts, labelled HYPOTHESIS, and marked as needing a partner's review.

Why this seat matters now
Two lines: where the seat stands (from the dates and successor status) and why it may matter (other exits, a no-replacement statement, private equity control, seniority).

Questions for the partner
Three questions: who owns the hire and whether we know them (check in PINE), the successor or internal-cover question, and the timeline.

Talent pools to map
Company types only, chosen by the role's function and the practice. Never a named person, never a named company.

The top seat's brief, as generated

HYPOTHESIS **Why now**

- The exit took effect on 31 Oct 2026, 2 days ago, and the filing names no successor, so the Chief Technology Officer seat may be open now unless a later filing names someone.
- The company says it does not plan a like-for-like hire, so treat this as a watch, not a live search.

HYPOTHESIS **Questions**

1. Who owns this hire at Laxmi Organic Industries Limited, and does Positive Moves already know them? (Check in PINE.)
2. If the role is absorbed internally, which remaining leaders now carry more, and are any of those seats at risk?
3. Who is covering the role now, and how long can that arrangement last?

HYPOTHESIS **Talent pools** (Technology and digital · CXO)

- Listed industrial, infrastructure and manufacturing companies with an established digital function
- Consumer-internet and software-product companies
- Industry practices of IT services firms that serve industrial, infrastructure and manufacturing companies

Before outreach

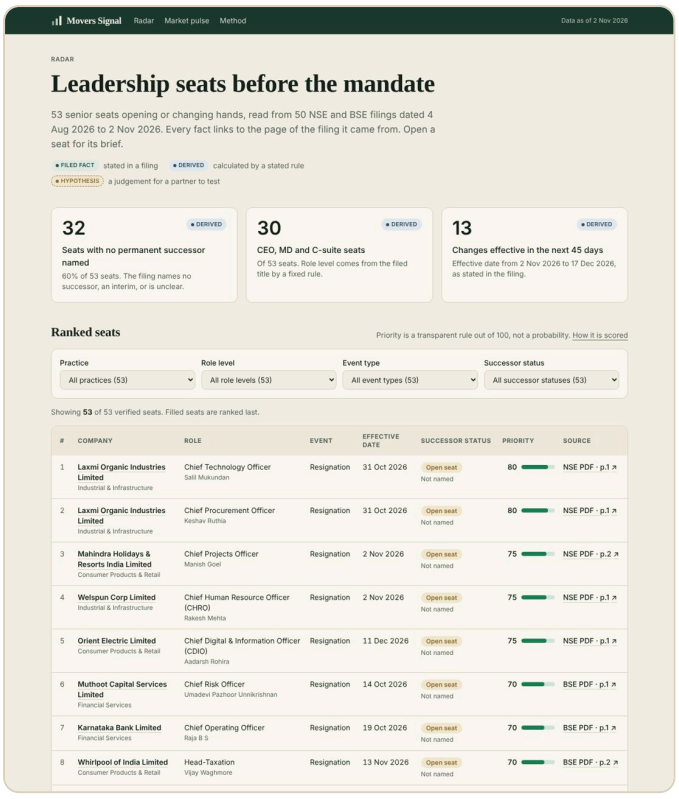

Each brief ends with four checks: off-limits and client conflicts, existing relationships, prior search history (all three need PINE), and a partner's approval. They show "Needs PINE access" because they need Positive Moves' own systems. No result is simulated.

The guardrails, all enforced

- No candidate is named anywhere; talent pools are company types.
- No personal phone number or e-mail address is stored or shown; the site check scans every page for them.
- The reason for leaving is shown only as filed; nothing is inferred.
- Every item is labelled Filed fact, Derived or Hypothesis.

The four screens

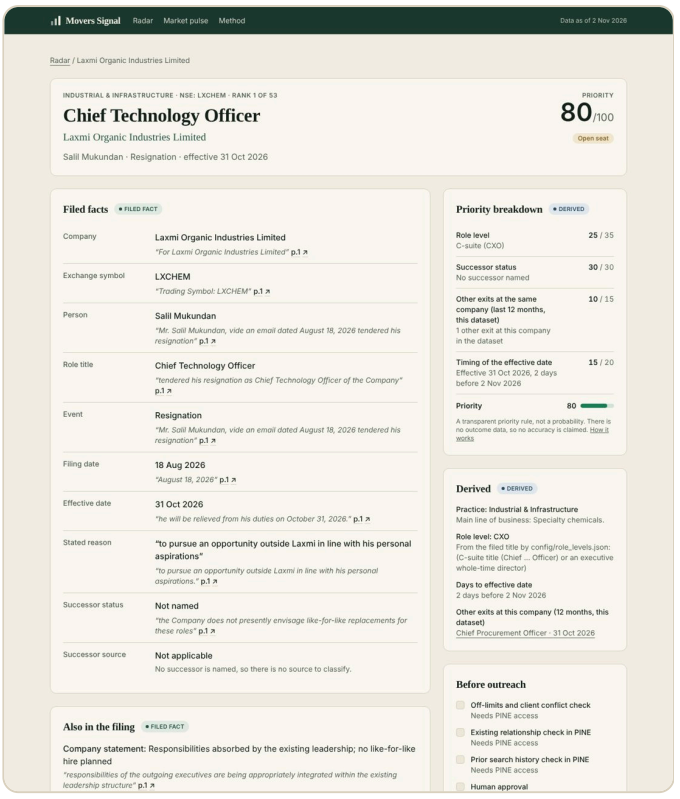

1 · Radar

Headline, the three numbers, filters, ranked seats.

- Three numbers, computed live from the verified seats: 32 with no permanent successor, 30 CEO, MD and C-suite seats, 13 effective in the next 45 days.
- Four filters (practice, role level, event, successor status). They live in the web address, so a filtered view can be sent as a link.
- Ranked table: company, role, event, effective date, status, priority, and the source PDF at the right page. Filled seats sit at the bottom.

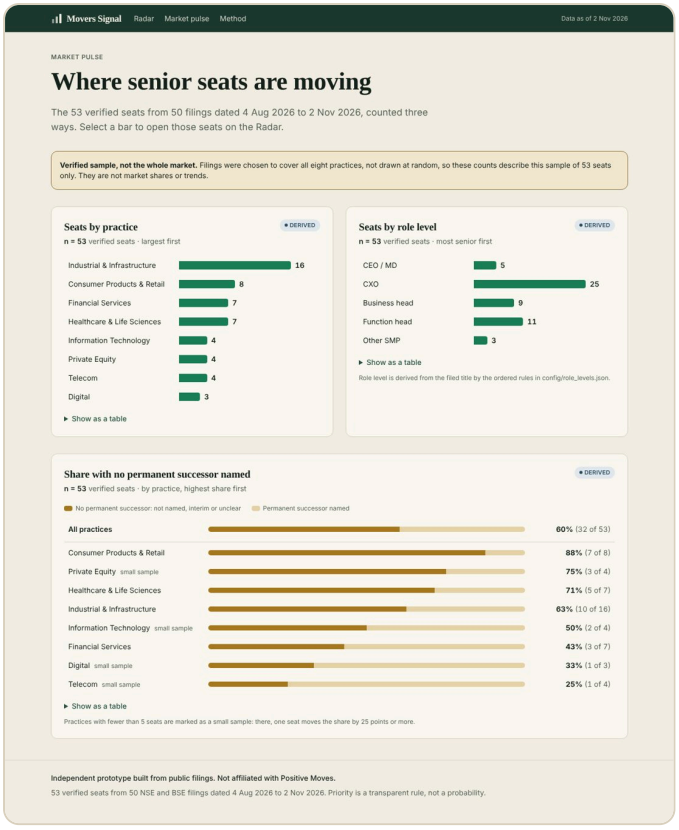

2 · Seat brief

Filed facts with quotes, priority breakdown, derived fields.

- Filed facts, each with its quote and a link that opens the PDF at the cited page.
- Priority breakdown with the reason for every point; derived fields with the rule that produced them.
- Hypotheses, the before-outreach checks, and the source and review record (hash, verification counts, corrections).

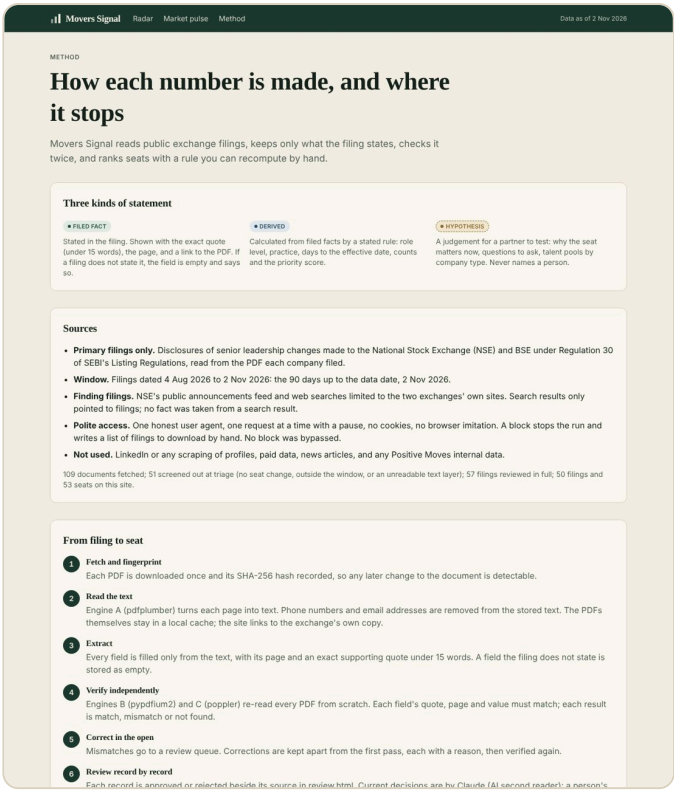

3 · Market pulse

Seats by practice and role level; share with no permanent successor.

- n = 53 on every chart and a clear "verified sample, not the whole market" note: the filings were chosen to cover all practices.
- Every bar opens the Radar filtered to those seats. Each chart has a table view.

4 · Method

Sources, pipeline, audit, definitions, score, limits.

- The audit counts come straight from the pipeline's log, and the link check date is shown.
- The score section has the weights and a worked example that is recomputed on every build.

The site works on a phone (no sideways scrolling at 390 px) and in dark mode.

The demo script

Start on the Radar, go one level deep on one seat, prove a fact against its PDF, then step back to the pattern and the method. Keep the PDF click: it is the moment that earns trust.

1. **Open the Radar (1 minute)**
   `/` Point at the headline and the three numbers. "32 of 53 seats have no permanent successor named. 30 are CEO, MD or C-suite. 13 change hands in the next 45 days."
2. **Read the top row (30 seconds)**
   "The top seat is Chief Technology Officer at Laxmi Organic Industries Limited, priority 80. Every row links to the filing at the exact page."
3. **Open the brief and prove one fact (1.5 minutes)**
   `click the company name` then `p.1 ↗ next to the effective date` "Here is the quote, here is the page, and this is the company's own filing on the exchange. Every fact on this page works like that."
4. **Walk the priority breakdown (1 minute)**
   "25 + 30 + 10 + 15 = 80. Role level, no successor, another exit at the same company, and timing. It is a priority rule, not a probability; the weights are in one file and we can argue about them."
5. **Show the judgement layer (1 minute)**
   "These three sections are hypotheses for the partner: why now, the questions to ask, and talent pools by company type, never names. Before anyone reaches out, the conflict, relationship and history checks run in PINE. I have not faked those."
6. **Filter like a practice lead (1 minute)**
   `Practice: Financial Services` then `Successor status: Not named` "This is the view a Financial Services partner would open on a Monday: 7 seats in the practice, 3 with no successor named. And the link can be shared as it is."
7. **Market pulse and Method (1 minute)**
   "The charts carry their sample size and say plainly that this is a verified sample, not the market. And Method shows the audit: 32 issues found in the first check, 26 fixed, 7 records rejected, every source link re-checked."

> CLOSE WITH THE NEXT STEP
> *If we connected this to PINE, every one of these seats would arrive with the relationships we already have at the company and the conflicts to avoid. And once we compare priority with the mandates that actually came in, the weights stop being my judgement and start being evidence.*

If something goes wrong in the room

- **A PDF link is slow:** exchange sites can be slow; the brief already shows the quote and page, so carry on and come back to it.
- **Asked about a seat you do not know:** open its brief; the facts and quotes are there. Never improvise a reason for an exit.
- **No internet:** run the site locally (`npm run dev`); everything except the PDF links works offline.

Questions you may get

Q How do you know the data is right?

Three independent text engines, corrections in the open, a review step, and checks that fail the build. The first verification run found 32 issues; 26 were corrected and re-verified, 7 records were rejected with reasons. Every fact shows its quote and page so anyone can check it in seconds.

Q Why not use LinkedIn or news?

LinkedIn scraping breaks its terms and is not a primary source; news is second-hand. The company's own exchange filing is first-hand, dated and public. That is the standard a partner can stand behind with a client.

Q Does the score predict which seats become mandates?

No, and it does not claim to. It is a transparent priority rule. To measure prediction we need outcome data: which seats turned into mandates. That is the first thing to add with Positive Moves' data.

Q Why these weights?

Seniority and an open successor question matter most for retained search, then team churn and timing. They are a starting judgement in one config file. Change a number, rebuild, and every seat is re-ranked, so the weights can be agreed with the partners.

Q Why only 50 filings?

It is a verified sample for a prototype, chosen to cover all eight practices. The pipeline is the product: the same steps run on every filing in the window. Scale is a scheduling question, not a redesign.

Q What about private companies?

They do not file these disclosures, so they are out of scope here. That is a stated limit. Other public sources (for example company registry filings) could extend it later, with the same rules.

Q How would this connect to PINE?

Join each seat to PINE on company: existing relationships, off-limits and client conflicts, previous searches. The brief already has the empty checks waiting for those answers.

Q What did the AI do and what did you decide?

The rules, the weights, the guardrails and the review standard are explicit decisions in config files. Automation did the heavy reading and checking. The review decisions so far are by Claude (AI second reader); human sign-off is the next step, and human decisions override automated ones.

Q What happens if a company corrects a filing?

Each PDF is fingerprinted with SHA-256. The link check re-downloads every source and flags any change; the record is then re-extracted and re-verified. The last check (2026-11-02) found all 53 unchanged.

Q Is any personal data a problem?

Only what the company itself filed publicly: names, roles and dates. Phone numbers and e-mail addresses are stripped from stored text and checked for on every page. No candidate is ever named.

Q Why does a seat with a named successor still score?

The seat itself may not need a search, but the successor's previous seat may now be open, and the change is still worth a relationship call. The gate pushes filled appointments to the bottom so they never crowd out open seats.

Q How long would daily running take?

The pipeline is polite by design (one request at a time, with a pause), so a day's filings take minutes. Review is the real cost, which is why only mismatches go to a person.

Q What would you do in the first 30 days?

Get human sign-off on the current records, connect PINE for the three checks, run the pipeline daily on the full feed, and start logging which seats became mandates so the weights can be tested.

Q What is the weakest part?

No outcome data yet, so the priority rule is judgement. Second, rules for role level and practice can mislabel an unusual title. Both are visible and easy to change, which is the point of making them rules.

Limits, next phase and cheat sheet

Known limits (say them before you are asked)

- Listed companies only; private companies do not file these disclosures.
- A sample of 50 filings chosen to cover all eight practices, not every filing in the window.
- No outcome data, so the priority rule cannot be called accurate or inaccurate yet.
- "Other exits" counts only exits inside this dataset.
- Role level and practice come from rules; an unusual title can land at the wrong level.
- Review decisions so far are by Claude (AI second reader); a person's sign-off is pending.

Next phase

1. Join each signal to PINE: relationships, off-limits and client conflicts, past searches.
2. Compare priority with the mandates that actually followed, then tune the weights on that evidence.
3. Run the pipeline daily on the exchange feeds, with the same verification and review.

Cheat sheet

Numbers

53 seats · 50 filings · 8 practices · 4 Aug 2026 to 2 Nov 2026
32 no permanent successor (60%) · 30 CEO, MD, C-suite · 13 in the next 45 days
32 issues found · 26 fixed · 7 rejected · 53/53 links confirmed
Top seat: Chief Technology Officer, Laxmi Organic Industries Limited, 80

Words

Say: *priority*, *filed fact*, *verified sample*, *hypothesis for the partner*, *needs PINE access*.
Never say: *probability*, *predicts*, *the AI found*, *the market* (it is a sample), or any guess about why someone left.

Rule 1

Only primary filings. If it is not in the filing, it stays empty.

Rule 2

Every fact has a quote, a page and a link.

Rule 3

Priority orders attention. It is not a probability.

Where everything lives

Website code and data	`interview-demos/movers-signal in the GitHub repository (branch claude/zen-clarke-duln2y)`
Lovable copy	`https://lovable.dev/projects/bdf5fab5-1072-4a69-819f-9212e5df15e8 (Lovable editor; the preview needs a Lovable sign-in until it is published)`
Run it locally	`npm install, then npm run dev; npm run check:all runs every quality gate`
Review screen	`review.html: approve or reject each record beside its source`
Audit trail	`AUDIT.md: every correction and every rejection with its reason`
